

Looping

Programmers use looping to make writing code easier. Consider a program that requires you to do the same thing continuously, so instead of writing the same code repeatedly, just write the code once and “loop” it.

Loop tool is in the flow control section of the tools.

Drag the loop tool onto the blue workspace.

Choose the type of looping that you want to perform.

Forever: Do the same repeatedly until the end of time.

Count: Loop the program “x” amount of times.

Conditional: For example

[If Variable1 is greater than Variable2 then fall through the loop and continue to the next action]
